

Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement

Password policies
Firewall maintenance
Multifactor authentication (MFA)

Part 2: Explain your recommendations

By using **password policies**, employees will be required to maintain strict and strong passwords. This will force them to create new passwords and strengthen existing ones, reducing the risk of unauthorized access.

Firewall maintenance is important to filter incoming and outgoing network traffic and to apply specific rules that help mitigate the chances of the organization being hacked again.

MFA, such as biometrics, can reduce the chance of unauthorized logins by requiring additional verification when accessing systems or websites.
